ECFO1 BLOCKED FILTER ISSUE

The filter gets clogged with use because the coffee contains non-soluble oily substances which gradually form a sediment in the thin gap between inner and outer wall.

Sediments can be seen in this opened filter.

The sediments are alcohol soluble, so to clean the filter, follow the procedure below.

1. Place the filter in a cup.
2. Fill the filter with alcohol (We used de-naturated ethylic alcohol).
3. Wait until the alcohol has passed through the filter.
4. Repeat step 2 & 3 at least 3 times.
5. Rinse the filter with water.
6. Replace filter back into the machine and complete 3 brewing cycles with no coffee.
7. Water should flow freely through the filter, if not, repeat cleaning process again.

New filters have a detachable insert with gasket, which allows the customer to disassemble and clean the filter more easily.
