

FOR INFORMATION ONLY

SEALED PLATE ELECTRIC HOB INFO

Before first use a **burn off** procedure must be performed, as sealed plate electric hobs are coated for protection during manufacture and transportation.

Burn Off Procedure

Please ensure you have adequate ventilation available when performing this procedure, open doors and windows or switch on extractor fan / cooker hood.

- 1) Place a correctly sized saucepan of water on **two** cooking zones.
- 2) Switch to a high setting for 2 - 3 minutes or until the smoke and steam dissipates.
- 3) Repeat for the other zones.

This will "burn off" the protective coating.

Please ensure only two cooking zones at a time are used, this is to prevent overheating.

IMPORTANT!

Do not carry out this procedure without any pans on the cooking area, as the hotplate and the hob area may overheat and discolour.

Smoke and steam may be visible but ***this is normal***. Steam may also occur from beneath the hob.

Once this procedure has been completed correctly, no more smoke or steam will occur during use.
